Abstract. What determines the diversity of cultural material produced in a market? In many consumer product markets, periods of competition support cultural diversity, but alternating periods of concentration drive cultural homogeneity. A stable partition can emerge, separating a culturally homogenous market center from a culturally diverse periphery. Cultural diversity exists temporarily, or is relegated to the market fringe. These conditions are reflected in the choice faced by organizations: grow in the market center by producing culturally generic material, or attract a smaller, more engaged consumer base by producing culturally distinct material in the periphery. I examine a different market context: ecologies of attention, in which consumers can readily engage with multiple organizations (e.g., online communities, voluntary organizations) simultaneously and easily transition from being consumers to also producers of content. I study Reddit as a case of an attention ecology, leveraging user participation data and the text of over 2 billion comments from over 14 thousand subreddits. I find that subreddits face a tradeoff contingent on their location in the resource space, enabling cultural diversity to survive in crowded, competitive locations, while cultural homogeneity emerges in sparse, uncompetitive areas. I draw on these findings to introduce a broader theory of market partitioning.
